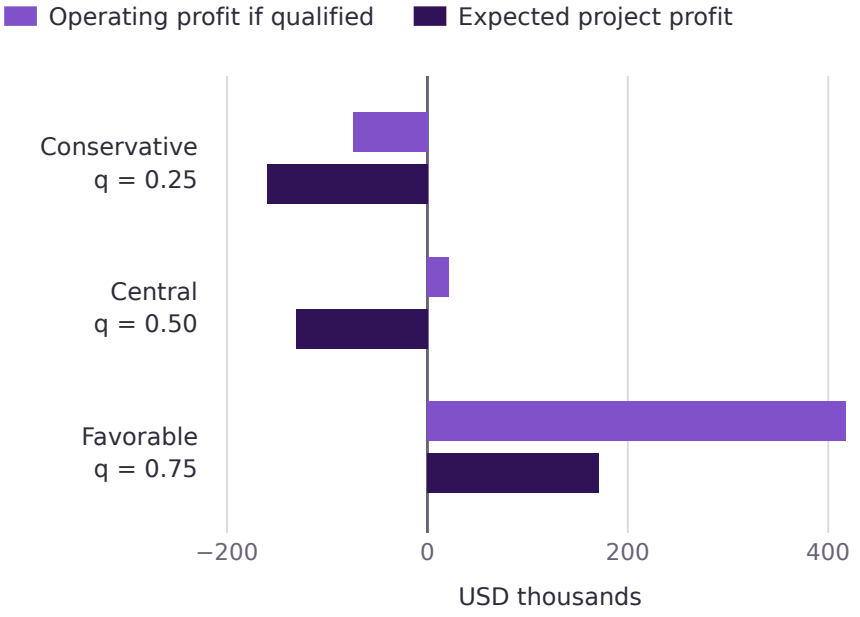
Conditional economics across three scenarios

12 production months after assumed physical qualification



MEAN / EXPECTED USD

Conservative q = 0.25	−$73,910.25 / −$160,269.86
Central q = 0.50	$20,979.00 / −$131,302.80
Favorable q = 0.75	$417,868.10 / $171,608.78

Project = q × mean operation − A; central A = $141,792.30.

R&D: 9 months here; low/high duration scenarios are 3/18 months.

Constructed scenarios; q is uncalibrated. No actual collections.

Customer value, demand, physical success and costs remain unvalidated.
