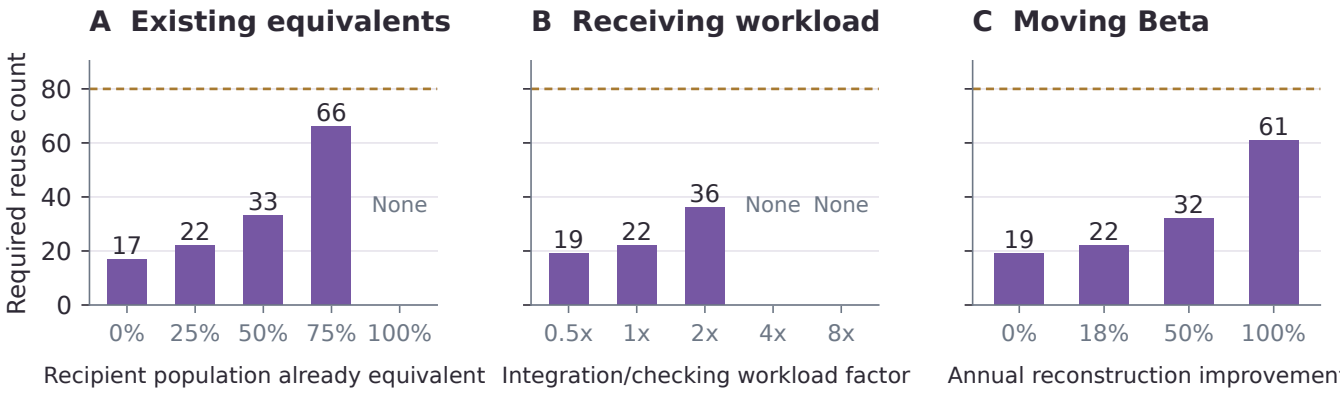
# More overlap or receiving work raises the reuse requirement

MODELED RETENTION SENSITIVITY | One factor varies; no empirical efficacy claim



Dashed line: 80 planned uses. 'None': no finite threshold under the supplied cost assumptions;
it is not zero uses. Candidates are optionally unused when they do not improve the competent baseline.

Fixed 40-week lifecycle allocation; conditional mean savings. A stronger Beta means less reconstruction work,
not an assumed intelligence or acceptance multiplier. These are separate analytical scenarios, not selected policies.
