Executive brief

AGI ALPHA FLYWHEEL — When Capability Creates Opportunity

Vincent Boucher — President of MONTREAL.AI
27 October 2026 · Frontier-search research edition 2

Strongest supported result

The team made twelve opportunity proposals inspectable through primary-art comparisons and eight executable probe families. A second mathematical implementation confirmed a known quantum transmission construction, and the actual Insight/Nova-Seed/FusionPlan/MARK components preserved its rejected novelty verdict through 19/19 local checks.

No candidate passed the flagship gate. This is a completed exploratory research record, not a new profitable offering or a claim of beyond-human foresight.

Evidence stream	Result
Frozen discovery comparison	U: 0/4 selected; E: 0/4 selected; one session each
Separate follow-up	Four additional candidates; none selected
Numerical confirmation	8 spectral + 8 regional + 5 quantum cases pass scoped checks
Existing component reuse	19/19 checks; local fixtures, no productive eligibility
Commercial result	No qualified offering; no customer collections; actual cost/profit unknown
Operational / retained Alpha	No numerical gain established; no E+ investment admitted

What the construction taught us

Four cyclic-order depolarizing channels yield herald probability 7/16, conditional fidelity 5/7, and a negative Choi partial-transpose eigenvalue −1/14. This is an exact reproduction of the published mechanism, so it is supporting evidence rather than the discovery. The proposed small heterogeneous extension follows by continuity from the known result.

Other probes exposed missing information: a shared DNA-writing rate cannot supply an independent physical clock; unrestricted spectral cubes remain ambiguous under insufficient measurement dimensions; region-level clearance can be ambiguous even with positive optical transport. The regional example does not refute whole-room vacancy detection. Narrower material and chemistry specifications remain unconstructed rather than proven impossible.

Economics and the investment decision

There is no supported price, sales volume, or profitable launch region for this edition. Hypothetical unit margins are not converted into revenue. All current unpaid exploration is Category C research; paid delivery A and qualified retained investment B are absent.

Human-led broad-scan planning costs are $3,418 / $10,363 / $32,475 for 46 / 84 / 154 person-hours, including modeled compensation, overhead, and tools. Separate automated budget scenarios are $4.75 / $32.50 / $145. The human cases exclude full-paper production and commercialization. The separate AI figures are assumed token and resource budgets, not scope-matched estimates or actual usage; neither establishes observed savings. Optional specialist review is separately priced at $648–$2,590. Actual hosted inference, tools, infrastructure allocation, and owner effort are unknown.

What a successor inherits

The package preserves the original submissions, unequal amendment timing, sources and access failures, exact probes, scope corrections, cost model, and local research-only seed and plan. An ordinary directory containing the same information can convey the same research knowledge. Cryptographic provenance does not make the rejected idea true or novel.

The smallest useful next step is one mechanism-specific, two-page proposal against the strongest comparator, followed by a decisive bounded test only if a substantive difference survives. A dry-storable binder from mixed cement fines is an unresolved product specification worth considering; a distinct reactive precursor or bonding mechanism must come first. No new experiment, purchase, customer outreach, or live authority is implied by that suggestion.

Decision for publication

Publish or review this as a negative frontier-search edition. Preserve the requested title and ambition, but keep the discovery result beside every headline. The full paper, standalone reader, executable study, and LinkedIn draft accompany this brief. Canonical repository publication remains governed by the existing owner and qualification process.
