AGI ALPHA FLYWHEEL — When Capability Creates Opportunity

Transformational Intelligence, Experience-Trained Specialists and the Expanding Frontier of Profitable Work

Vincent Boucher — President of MONTREAL.AI

27 October 2026 · This companion binds claims to executed receipts, identifies unknowns, and preserves the distinction between fixed conformance, fresh transfer and commercial acceptance. All paths below are relative to the new study directory unless another root is named.

1 Claim register

Claim	Evidence class	Receipt and practical limit
Six opportunities investigated before selection	Sourced / recorded	`discovery/selection.json`, two detailed dossiers and search log. Specific gaps, prior art, construction, tests and falsifiers preserved.
64 v1 dispositions conform	Observed on injected fixtures	`results/confirmation-v1/summary.json`. 20 updates, 4 unchanged, 36 holds, 4 rejects. Not 64 accepted services.
U/E/E+ each satisfy 18 criteria	Observed AI sessions and review	`validation/review/independent_assay_adjudication.json`. One session per arm; same internal model, no exact token/billing telemetry.
Recovered bytes execute on fresh mapping	Observed local transfer	`assay/recipient_eplus/`. Generic archive recovered through existing fixture; teacher work fresh to recipient, not whole-team holdout.
Same-content library ties	Observed control	`integration/results/library-equality-v1/summary.json`. 5 checks; 32 cases per separate process; no graph-specific advantage.
v1 semantic ingestion insufficient	Observed post-confirmation diagnostic	`validation/review/independent_review_diagnostics.json`. Contradictory extra fields ignored; no cumulative event state.
v1.1 strict snapshot correction	Prospective bounded confirmation	`results/correction-v1_1/summary.json`. 46 fresh cases, 64 separate regressions, 54 preserved hashes. No new recipient transfer.
Existing native controls pass	Observed execution with simulated identities	`integration/results/capability-v1/summary.json`. 29 controls. Unsupported scientific production scope correctly refused.

Claim	Evidence class	Receipt and practical limit
Economic accounting consistent	Observed exact scenarios	`economics/results/controls-v4/controls.json`. 24 controls; earlier development corrections retained. No actual sales.
Fixed-cost threshold / cash stresses	Assumed inputs, exact computation	`economics/results/conditional-boundaries-v1.json`. 135 threshold cases, 6 cash paths, 9 retention cases. No fitted demand or cost saving.
Admission bound can be reachable or impossible	Analytic / control evidence	`integration/results/reachability-controls.json`. 12 boundary controls; necessary condition only.
Profitable newly feasible offering	Unmeasured / not established	Customer revenue 0; complete actual research/delivery cost unknown; no positive monetary admission.

2 Frozen source identities and rights

Research parent	231834269599d85e49cfe1ca9917a1a874522d44
Runtime parent	80b345828f34fd8a6e592977dd17ef37141305f4
metadat source	0cb96ce4ff16586a9dbc8a9b0f9bc617538d2738
Crop source	623148fa24df4eef59c65bd6eef5fb53b6a433bb
Original v1 archive SHA-256	daa27a2f32cd959757300c9df18be518166027729d549d46f1c422bed999223f
v1.1 source SHA-256	27c40889c0b11bd3d837034f21cf9a93f11d4b002628e253ff2e8f2d84a66921

Original metadat text, build scripts and documentation establish the mapping. Its GPL-2.0-or-later package license is preserved; normalized CSV is separately described as a serialization change. The crop readme, notebook and AGPL notice are preserved. The crop workbook was obtained during discovery and is preserved separately, but was excluded from all three identical semantic-assay packets. The assay therefore does not establish inability to reconstruct a full crop analysis when that workbook is available. Primary-study PDFs and proprietary customer data are not represented as retrieved. New generic code is Apache-2.0. The transferred archive excludes source datasets and protected evaluation material. The full bundle has multiple original licenses, not one blanket replacement license.

The three foundations were retrieved at the research parent and read in full. Their Git blob IDs and the 46-record interface/source audit are in `integration/source-audit.json`. The 43 predecessor integration files were retrieved exactly; its 29-file closure remains unchanged. The final source-integrity replay verifies 129 bindings across 108 unique files. Mutable web sources have retrieval dates; those dates do not freeze future web content.

The latest corrected-study material available for *The Advantage That Survives* is its coordination notice, not its private 28-page paper or full ledger. Its notice-reported hash is not called an independently downloaded PDF. No earlier correction is removed or its assessment expense recovered retrospectively.

3 Selection and transformation trace

The selected opportunity is evidence continuity for synthesis owners with imperfect legacy evidence. Established alerts, living analyses and expert retraction-impact methods are included as prior art. The remaining hypothesis is affordable reconstruction and revalidation under the original purpose. The experiment's supplied tables do not validate arbitrary paper-to-data extraction or autonomous dependency discovery.

Original purpose	A justified quantitative answer with the original units, study identity, uncertainty and admissibility policy.
Restrictive assumption	Every later source change requires another bespoke reconstruction because the report does not carry executable meaning.
Proposed change	Source-to-effect-to-model packet, purpose digest, rights/authority check and scoped snapshot revalidation.
Observed realization	Two conditional numerical reproductions, fixed injected events, fresh-recipient teacher mapping, incompatible-crop refusal.
Falsification evidence	v1 accepts contradictory extra event fields; sequential use resets to the original packet. These findings narrow its scope and motivate a prospective correction.
Unestablished bridge	A real legacy reconstruction with lower complete cost than a strong expert, continuing acceptance after actual source changes and a fundable buyer arrangement.

The selection budget was declared before construction. The systems log records nine initial substantive reads, and the additional challenge records four more, supporting the frozen total of thirteen. Both logs are included. `discovery/budget-reconciliation.json` explicitly supersedes a draft note that had omitted the second phase. The declared 32-document cap is not an audited total of every root/tool read. No external purchases occurred, but actual complete research cost is unknown.

4 Confirmation, diagnostics and prospective correction

The original construction and confirmation freezes are under `protocol/`. Seeds 77319/77320 generate the 64 declared event cases after method freeze. Numerical references come from rendered metadat examples retrieved 27 October 2026 and a separately implemented analytic score root. The original source `.Rd` files contain example code, not those rendered outputs. R/metafor was not executed.

Writing: estimate 0.2219286219; standard error 0.0460339069; normal 95% interval[0.1317038223,0.3121534215]; heterogeneity 0.0499386749. Teacher: estimate 0.0837012423; standard error 0.0516406717; interval[−0.0175126143,0.1849150989]; heterogeneity 0.0188182886. These are conditional model reproductions. Unknown cohort dependence and primary measurement provenance remain scientific limitations.

The separate review records nine diagnostic observations plus two analytic numerical controls. It shows that explicit overlap events hold, but v1 ignores unexpected covariance/source fields on an otherwise allowed correction. It also executes a withdrawal followed by a correction: separate outputs have 18 and 19 rows. This is evidence of independent snapshots, not maintained history. Source hashes cannot detect an outside correction that nobody supplies.

v1.1 freeze	27 October 2026,16:23:08.556843 UTC; candidate, requirements and generator hashed.
Generation	16:23:13.061059 UTC; seed 91824067; expectations saved before execution.
Execution	16:23:16.830237 UTC; 46/46 fresh cases. 35 holds, 1 reject, 8 recomputations, 1 unchanged and 1 independent two-event batch.
Regression / preservation	64/64 v1 cases preserved separately; 54 original source/v1/recipient hashes unchanged.
Correction scope	Strict per-kind allowed fields; unknown/contradictory metadata holds; explicitly independent snapshot outputs; sequential/cumulative modes refused.
Remaining limits	Caller adjudicates event kind/scope; no notice detector, chronological ledger, primary scientific validation, live identity, fresh recipient transfer or commercial admission.

The correction is a new candidate; it does not improve the recorded v1 assay retrospectively. Old freezes and failures are not edited. Both versions decline production admission and commercial acceptance. A permissive boolean in a mission fixture is not a live authorization credential.

5 Operational assay and lineage

Recipients receive the same eight original files and two tasks, with normal tools and equal stated caps: eight operations, ten minutes and 12000 final-answer characters. U receives a competent direct task. E also receives the frozen concise source/meaning checklist. E+ also receives the actual recovered v1 archive, verifies its digest, and executes at least one check from the inherited content.

Arm	Checks	Operations	Seconds	Retries	Additional access
U	18/18	6	259.94	2	None beyond original sources and tools
E	18/18	4	281.03	0	Frozen expert checklist
E+	18/18	5	237.27	1	Checklist plus recovered generic code

U’s retries concern condensing the saved answer to the character budget. E+’s extra read resolves truncated display output. E’s original log counts four wrapper calls plus four nested execution calls as eight; the table normalizes those to four execution operations. All original logs remain unchanged. Exact tokens, billing, concurrency overhead and prior model knowledge are unmeasured. Output length alone is not token cost. No causal latency advantage is inferred.

The separate reviewer binds hashes and source coordinates for all 18 rubric items. Both teacher and crop work are accepted as semantic-control answers. The crop refusal is not a delivered quantitative crop analysis. Teacher source work is new to recipients but already inspected by the constructor; the public sources may be in model training. Procedural role separation is not a secure holdout barrier.

The transferable lineage is: established REML and source semantics; constructed adapter/checklist; inherited authenticated transport and ledger; recipient-specific teacher mapping; independent diagnostic; prospective strict-schema revision. A stronger inherited artifact does not establish an improved invention process. No model-weight learning or Specialist ASI result is claimed.

6 Economics, cash and admission

All commercial figures are hypotheses. The narrow H reference is an explicit estimate of 4–12 hours at USD 100–200/hour, not a quote. Prices USD 500/800/1200 are a sensitivity grid,

not measured willingness to pay. Official model token prices are sourced, but this edition's token counts and complete actual costs are unavailable. A hypothetical 60000-input/10000-output workload would cost USD 1.10 in Astra tokens or USD 0.11 in Terra tokens at listed standard rates, before all other costs and rate adjustments.

For the no-deposit threshold model,

$$K_{\max} = psn(aq - c) - G.$$

With $p = .9$, $s = .9$, $n = 4$, $a = .95$, $q = 800$, $c = 325$, $G = 200$, $K_{\max} = 1209.40$. Full fixed construction plus extra retention must be strictly lower to give positive expectation. 135 exact grid results do not estimate demand. Neither E nor E+ is assigned a cost reduction. The unrestricted expert can select the same instrument and arrangement; the unpriced 2×2 study template remains unpriced.

The distinct deposit-bearing cash illustration uses capital 4000, reserve 500, four refundable 100 deposits, construction 1500, coordination 200, and delivery/support 325 per served buyer. Accepted price 800 includes the deposit. On success, earned collections 3200 minus full delivery cost 3000 yields 200. One final default reduces earned collections to 2500 and profit to−500. Common failure refunds deposits and loses 1700. One withdrawal loses 275. Delay moves final collections from day 10 to day 40. Underfunded capital 1000 stops construction while holding 1400 cash, 400 refund liability and 500 reserve: available funds 500, no revenue.

A	Complete paid-job delivery and required learning, corrections, support and necessary coordination. This research is not retroactively called paid work.
B	Additional assessment, retention, rights, admission, sharing and upkeep, charged only when not already in A.
C	Optional R&D or Gym beyond an accepted paid outcome. Complete actual research expense is unknown.

The ledger distinguishes invoice, cash collection, capital, receivable, accrued cost, actual payment, refundable liability, reserve and available funds. Opportunity cost is separate from cash expense. 24 controls include duplicate-cost refusal, insufficient prefunding, negative expectation, supplier-credit handling and underfunded obligations. Known rejected-candidate/assessment expenses remain costs.

The necessary admission bound $(M - S)R - A - L$ can rule out structurally impossible assessments. 12 boundary tests pass; reachability is not approval. Historical 568-state impossible-hurdle results remain notice-reported post-confirmation diagnostics, with no recovered profit. No current candidate has the paired independent monetary evidence required for production Alpha admission.

7 Reproduction and publication boundary

The README supplies exact commands and predecessor dependency paths. The source snapshot is not a clean installation or a full Git checkout. Root execution used Python 3.12.14, NumPy 2.3.2 and SciPy 1.17.0. Isolated library recipients resolve NumPy 2.3.5 and the same SciPy; their outputs tie exactly. Pinned direct dependencies document the observed environment. A complete resolver-generated hash lock and clean dependency installation could not be verified.

`validation/reproduction-v1/summary.json` records a successful scoped replay:64 numerical checks, 29 inherited controls, 5 library controls, 24 economics controls, 12 reachability controls, 46 v1.1 fresh cases and 64 regressions. 129 source bindings across 108 unique files pass. The 135 thresholds, 6 cash paths and 9 retention scenarios reproduce exactly. Numerical data agree after excluding measured elapsed time. R runtime, strict SciPy typing, Black's dependency chain and full repository/hosted qualification are separately identified as unavailable or unrun; no success claim substitutes for them.

The final reproducibility manifest hashes delivered research files, the reused predecessor and foundations. It is created after final content assembly. It cannot be its own hash and is

excluded from its own inventory. Browser sources and generated PDFs receive visual/text verification separately. PDF authoring and HTML rendering do not establish scientific correctness or deployment approval.

Source coordination occurs in issue 4850. The publication rules in the frozen `docs/agent/PAPER_UPLOADS.md` preserve immutable original papers and distinguish passive PDF/TeX import from executable HTML qualification. Existing owners and the reserved paper-reader release remain authoritative. A public source proposal can be verified before the hosted reader exists. No hosted public-reader URL is claimed until its authorized release and actual bytes are verified.

8 Minimum next live evidence

The next prospective study needs a rights-cleared unfamiliar legacy packet with a real owner and an independently specified purpose; a fair human-service quote and strong expert tool access; full model/tool/operator/customer-effort metering including failures and corrections; a genuinely fresh held-out transfer; measured source-event coverage and cumulative state if continuity is sold; explicit participation, price, refund, rights and funding terms; and a predefined feasible-offering envelope. If both baseline and enhanced configurations qualify, report improved economics instead of a newly feasible frontier.

This edition does not satisfy those live gates. It supplies an executable instrument, a traceable correction, preserved negative comparisons and concrete tests that can reject the commercial hypothesis. Author attribution is supplied for the edition. Research, implementation, review, translation and drafting are AI-assisted; the reviewer is not a human external panel. The named author and repository owners retain final editorial and deployment authority.
