EXECUTIVE BRIEF | EDITION 2.1.0

AGI ALPHA FLYWHEEL — When Capability Creates Opportunity

Transformational Intelligence, Experience-Trained Specialists and the Expanding Frontier of Profitable Work

Vincent Boucher — President of MONTREAL.AI

FIND YOUR ALPHA. BUILD YOUR SUCCESSOR Ω.

A consequential opportunity: qualify a scientific model for its next use. A published model may support an equilibrium result while lacking the evidence needed for a physical-time prediction. This edition constructs an executable qualification instrument, transfers it, and tests whether expert operation changes accepted outcomes. All four routes pass: ordinary use, expert operation, the enhanced recipient and a conventional construction. The result is useful scoped capability, with commercial advantage still unestablished.

Explore before constructing

Six materially different candidates were investigated: biological mechanism discovery, laboratory protocol portability, elevation/datum qualification, legacy PLC migration, security qualification and physical measurement qualification. Their prior art, missing evidence and smallest decisive tests were retained. A bounded follow-up selected **S3: scientific-model reuse qualification**. The 2026 PEtab Select paper identifies the cost of comprehensive identifiability analysis and selective automation as an unresolved direction. This motivates selective qualification; it does not establish novelty or paying demand. [S1–S3]

The proposed service and its decision

Research software teams, core facilities and modeling services would receive a source-bound packet answering: *Which requested predictions are supported, what assumptions remain, and which measurement or analysis is needed next?* The packet includes executable calculations, source and request fingerprints, a specific unsupported-use witness, a calibration obligation and a fresh-scope decision. It preserves valid uses of the original model. It grants no execution authority and makes no biological validation claim. [S4–S6]

Constructed asset	What it makes inspectable
Reuse qualification instrument	Equilibrium, an external-clock ambiguity, conditional calibration and a changed-mission boundary.
Fresh recipient capsule	The exact retained code can be consumed without inheriting the prior mission's meaning or permission.
Arrangement checker	Participation, rights, acceptance, cash timing, withdrawals and failure are separate gates.

Decision for the enterprise

Retain this edition as a reproducible research instrument and a customer-discovery proposition. **Do not claim an economic feasibility crossing or admit the scientific capability to production.** A matched human-service quote, actual full-cost measurement, mission-specific scientific review and evidence of buyer acceptance remain necessary. Current native admission is unsupported for this scope, the evidence contains fewer than six independent task clusters, and its monetary denominator is unknown. [S5–S8]

EVIDENCE THAT CHANGES THE DECISION

A useful witness; no exclusive advantage

The original H4 source contains **252 public measurement rows at equilibrium**, 15 observable identifiers and a normalized 16-state model. Its selected eight-parameter fit is not disproved by the broader 33-parameter candidate space. The original study's fixed normalization remains valid. The new restriction concerns *reuse for a physical-time prediction*: a clock calibration is absent from the supplied source. [S3–S4]

Frozen mission	Computational result and meaning
Preserve equilibrium use	Mean acetylation 0.3764225583, conditional on the supplied fit; no new biological observation.
Challenge unsupported clock	Common rate scaling preserves equilibrium but changes a finite-time state by up to 0.1433168194. It exposes missing external time calibration, not a new fitted mechanism.
Propagate supplied calibration	An *assumed* conversion interval $[0.4, 1.6]$ per minute maps model relaxation time 1.2815393182 to $[0.8009620739, 3.2038482954]$ minutes. This is not a measured confidence interval.
Recheck a new purpose	The Boehm finite-time source requires fresh dynamic qualification. The recipient withdraws the inherited equilibrium witness; no new nonlinear fit is claimed.

Fair access to the formulation and conventional methods

All three hosted arms received the same scientific inputs, discovered formulation and acceptance requirements, with a 1,200-second/48-operation outer envelope. U had a reasonable brief and tools; E added the established expert workflow; E+ added the frozen instrument. A separately written conventional solution also qualified. [S5–S6]

	U	E	E+	Conventional
Accepted missions	4/4	4/4	4/4	4/4
Recorded wall time, s	366.1	390.9	383.3	not matched
Logged operations	13	16	14	not matched
Python executions	8	10	8	separate control

Operational Alpha, E–U: 0 accepted-outcome percentage points. Additional learned Alpha, E+–E: 0 points. These descriptive ties do not prove population equivalence. One campaign over two public source families, one recipient per arm and nonrandomized timings cannot establish a general latency effect or ordinary-human-user performance. Tokens, hidden compute, residual human attention and accepted-output dollar cost are unobserved. [S5]

The E+ recipient received byte-identical code and executed five instrument functions. The existing transport/access fixture passed **31/31 controls** with synthetic identities. This establishes technical transfer and fixture conformance, not live ENS authentication, production admission, a graph premium or independently possessed specialist intelligence. [S7]

COMMERCIAL BLUEPRINT

Sell an accepted decision; earn the next step

Offer. Begin with a tightly scoped, reproducible model-reuse qualification packet. Agree on the prediction, evidentiary standard, turnaround, customer effort and acceptable deferral before work. Obtain a comparable human quote and a buyer's alternative; price useful accepted work rather than marking up compute. Harvard Chan's published FY26 consulting rates of $193/hour for external academic clients and $265/hour for industry are a sequencing-analysis analogue, *not an S3 quotation*. No H4 price is inferred from them. [S8]

Deliver and account. Automate source preparation, supported calculations, evidence binding and packaging. Charge each activity once: A covers complete contracted delivery including learning required for that outcome; B covers additional assessment, retention, sharing and upkeep; C covers optional further research or Gym work. This edition's research was unpaid. Actual collections are **$0**; complete actual cost and profit remain unknown. [S5; S9–S10]

Conditional experiment	Decision-relevant result
New arrangement diagnostic	With zero assumed technical saving, conventional coordinated delivery is selected: $193.50 expected contribution, $300 successful contribution and $230 required opening cash. Inputs are arbitrary diagnostic conditions, not an S3 forecast. Seventeen of 32 fresh synthetic stress cases lose money.
Payment timing illustration	A separately useful accepted milestone can reduce required opening cash from $470 to $370, with successful contribution unchanged at $200. A ten-day release delay raises all tested routes to $840. Refundable principal remains encumbered.
Preserved enterprise evidence	The original simulation and its failures remain. A separately frozen controller chooses HOLD and improves modeled net value by $13.62320 versus the original shared policy on the same fresh worlds. This avoids assumed assessment losses; it is not new learned Alpha or recovered historical profit.

A bounded next decision

Run an independently reviewed pilot with actual prospective beneficiaries and fresh model families, including unsupported cases. Record complete cost and acceptance, obtain the human outside option, and test whether reusable construction saves adaptation work. Test shared construction and coordinated commitments separately and together. Preserve HOLD, conventional delivery and buyer nonparticipation as real options. [S9–S11]

Retain or expand only if prospective reusable benefits exceed additional costs and risks, current admission is supported, and available funds cover every dated obligation. A feasibility crossing requires the enhanced route alone to satisfy frozen useful-quality, deadline, customer-effort and price conditions at positive complete margin. No such crossing is observed here.

Evidence map. S1–S11 identify the dossier, public scientific sources, frozen instrument/protocol/results, native transfer, human-rate analogue, arrangement checker, preserved economics and foundations in the accompanying evidence companion. Complete paths, provenance, assumptions and reproduction steps are included there.

Provenance. AI-assisted researcher construction and internal review; no autonomous invention, new biology, new algorithm, model-weight training, live customer sales or token valuation is asserted. Earlier papers, corrections and failed trials are preserved.
